Question: Why is it true?

# DERIVATIVE OF AREA FUNCTION, $A(x) = \int_a^x f(t) dt$

$$A'(x) = \lim_{\Delta x \rightarrow 0} \frac{\Delta A}{\Delta x} = \lim_{h \rightarrow 0} \frac{A(x+h) - A(x)}{h}$$

# DERIVATIVE OF AREA FUNCTION, $A(x) = \int_a^x f(t) dt$

# DERIVATIVE OF AREA FUNCTION, $A(x) = \int_a^x f(t)dt$

$$A'(x) = \lim_{\Delta x \rightarrow 0} \frac{\Delta A}{\Delta x} = \lim_{h \rightarrow 0} \frac{A(x+h) - A(x)}{h} = \lim_{h \rightarrow 0} \frac{hf(x)}{h} = f(x)$$

When  $h$  is very small, the purple area looks like a rectangle with base  $h$  and height  $f(x)$ , so  $A(x+h) - A(x) \approx hf(x)$  and  $\frac{A(x+h) - A(x)}{h} \approx f(x)$ . As  $h$  tends to zero, the error in this approximation approaches 0.

It's possible to have two different functions with the same derivative.

$$A(x) = \int_0^x 2t \, dt$$

$$B(x) = \int_1^x 2t \, dt$$

It's possible to have two different functions with the same derivative.

$$A(x) = \int_0^x 2t \, dt$$

$$A'(x) = 2x$$

$$B(x) = \int_1^x 2t \, dt$$

$$A'(x) = 2x$$

$$B(x) = \int_1^x 2t \, dt$$

$$B'(x) = 2x$$

It's possible to have two different functions with the same derivative.

$$A(x) = \int_0^x 2t \, dt = x^2$$

$$A'(x) = 2x$$

$$B(x) = \int_1^x 2t \, dt$$

$$B'(x) = 2x$$

It's possible to have two different functions with the same derivative.

$$A(x) = \int_0^x 2t \, dt = x^2$$

$$A'(x) = 2x$$

$$B(x) = \int_1^x 2t \, dt = x^2 - 1$$

$$B'(x) = 2x$$

It's possible to have two different functions with the same derivative.

$$A(x) = \int_0^x 2t \, dt = x^2$$

$$A'(x) = 2x$$

$$B(x) = \int_1^x 2t \, dt = x^2 - 1$$

$$B'(x) = 2x$$

When two functions have the same derivative, **they differ only by a constant.**

In this example:  $B(x) = A(x) - 1$

If two continuous functions have the same derivative, then one is a constant plus the other.

Examples:

$$\int 2x \, dx =$$

## Definition

The **indefinite integral** of a function  $f(x)$ :

$$\int f(x) \, dx$$

means the *most general* antiderivative of  $f(x)$ .

Examples:

$$\int 2x \, dx =$$

$$\int \frac{1}{x} \, dx =$$

Remember: two functions with the same derivative differ by a constant, so we include the “ $+C$ ” for indefinite integrals.

# DEFINITE VS INDEFINITE INTEGRALS

For each pair of properties below, decide which applies to **definite** integrals, and which to **indefinite** integrals.

No limits (or bounds) of integration, $\int f(x) \, dx$	
Limits (or bounds) of integration, $\int_a^b f(x) \, dx$	
Area under a curve	
Antiderivative	
Number

## Power Rule for Antidifferentiation

$$\int x^n dx = \frac{1}{n+1} x^{n+1} + C$$

if  $n \neq -1$  is a constant

Example:

$$\int (5x^2 - 15x + 3) dx =$$

# ANTIDERIVATIVES TO RECOGNIZE

- ▶  $\int x^n dx = \frac{1}{n+1}x^{n+1} + C$
- ▶  $\int a dx = ax + C$
- ▶  $\int e^x dx = e^x + C$
- ▶  $\int \frac{1}{x} dx = \log |x| + C$
- ▶  $\int \sin x dx = -\cos x + C$
- ▶  $\int \cos x dx = \sin x + C$
- ▶  $\int \sec^2 x dx = \tan x + C$
- ▶  $\int \sec x \tan x dx = \sec x + C$
- ▶  $\int \csc x \cot x dx = -\csc x + C$
- ▶  $\int \csc^2 x dx = -\cot x + C$
- ▶  $\int \frac{1}{1+x^2} dx = \arctan x + C$
- ▶  $\int \frac{1}{\sqrt{1-x^2}} dx = \arcsin x + C$
