  - Doesn't work for every function

Fundamental Theorem of Calculus, Part 1

Let $a < b$ and let $f(x)$ be a function which is defined and continuous on $[a, b]$. Let

$$A(x) = \int_a^x f(t)\,\mathrm{d}t$$

for any x in $[a, b]$. Then the function $A(x)$ is differentiable and

$$A'(x) = f(x)\ .$$

Fundamental Theorem of Calculus, Part 1

Let $a < b$ and let $f(x)$ be a function which is defined and continuous on $[a, b]$. Let

$$A(x) = \int_a^x f(t)\,\mathrm{d}t$$

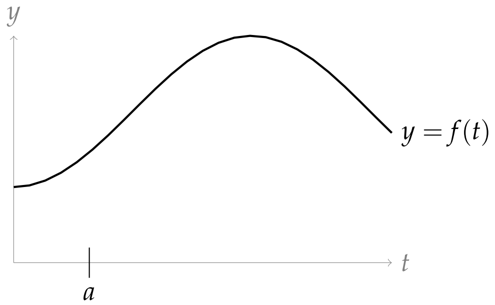
for any x in $[a, b]$. Then the function $A(x)$ is differentiable and

$$A'(x) = f(x)\ .$$

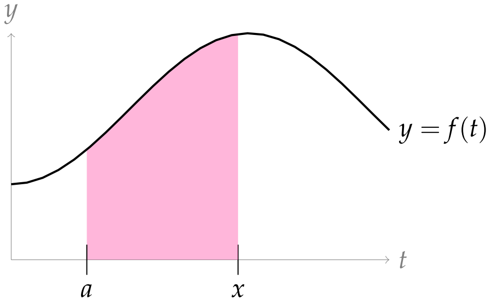
FTC(I) gives us the derivative of a very specific function (subject to some fine print).

It shows a close relationship between integrals and derivatives.

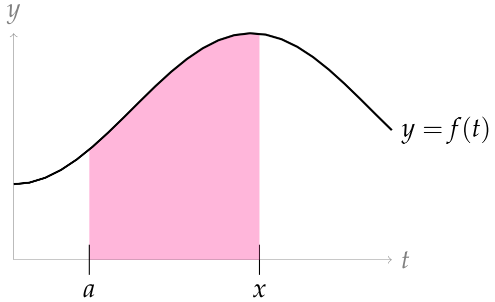
Area Function: $A(x) = \int_a^x f(t)\mathrm{d}t$ for $a \le x \le b$



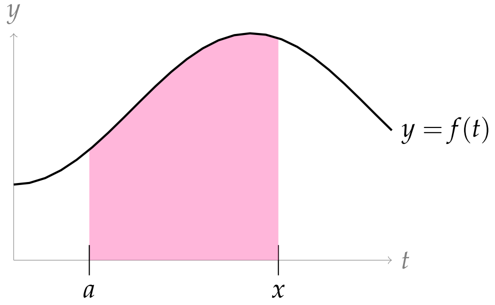
Area Function: $A(x) = \int_a^x f(t)\,\mathrm{d}t$ for $a \leq x \leq b$



AREA FUNCTION: $A(x) = \int_a^x f(t)\mathrm{d}t$ FOR $a \leq x \leq b$



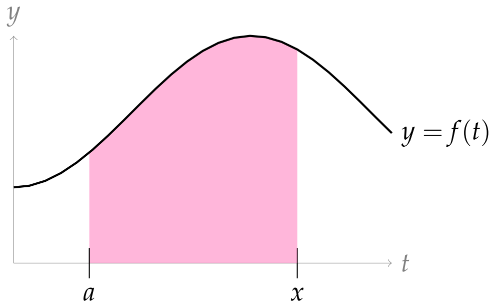
Area Function: $A(x) = \int_a^x f(t)\mathrm{d}t$ for $a \le x \le b$



Notation: the function A depends on the variable x.

We need to know how the function f behaves on the whole interval $(0, x)$ to find $A(x)$. That's why we use $f(t)$, not $f(x)$.

Area Function: $A(x) = \int_a^x f(t)\mathrm{d}t$ for $a \leq x \leq b$



Notation: the function A depends on the variable x.

We need to know how the function f behaves on the whole interval $(0, x)$ to find $A(x)$. That's why we use $f(t)$, not $f(x)$.

$$A(x) = \int_0^x f(t)\,\mathrm{d}t \qquad B(x) = \int_0^x f(x)\,\mathrm{d}t \qquad C(x) = \int_0^x f(x)\,\mathrm{d}x$$

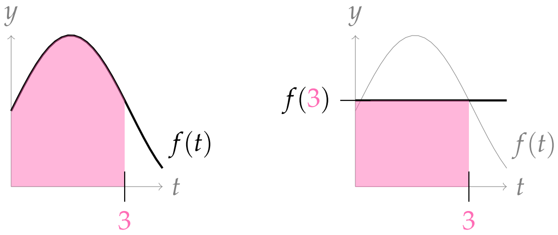
$$A(3) = \int_0^3 f(t)\,\mathrm{d}t \qquad B(3) = \int_0^3 f(3)\,\mathrm{d}t$$

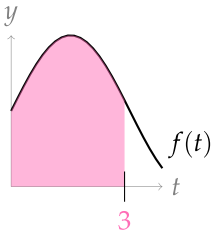


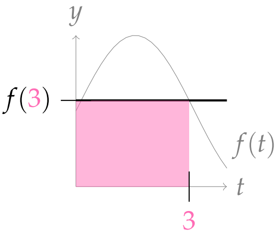
Area function notation

It might look strange at first to see two different variables. Let's consider the alternatives:

$$A(x) = \int_0^x f(t)\,\mathrm{d}t \qquad B(x) = \int_0^x f(x)\,\mathrm{d}t \qquad C(x) = \int_0^x f(x)\,\mathrm{d}x$$

$$A(3) = \int_0^3 f(t)\,\mathrm{d}t \qquad B(3) = \int_0^3 f(3)\,\mathrm{d}t \qquad C(1) = \int_0^1 f(1)\,\underbrace{\mathrm{d}1}_{??}$$





Fundamental Theorem of Calculus, Part 1

Let $a < b$ and let $f(x)$ be a function which is defined and continuous on $[a, b]$. Let

$$A(x) = \int_a^x f(t)\,\mathrm{d}t$$

for any x in $[a, b]$. Then the function $A(x)$ is differentiable and

$$A'(x) = f(x)\ .$$

Fundamental Theorem of Calculus, Part 1

Let $a < b$ and let $f(x)$ be a function which is defined and continuous on $[a, b]$. Let

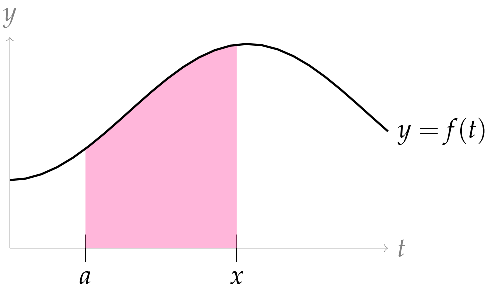
$$A(x) = \int_a^x f(t)\,\mathrm{d}t$$

for any x in $[a, b]$. Then the function $A(x)$ is differentiable and

$$A'(x) = f(x)\ .$$

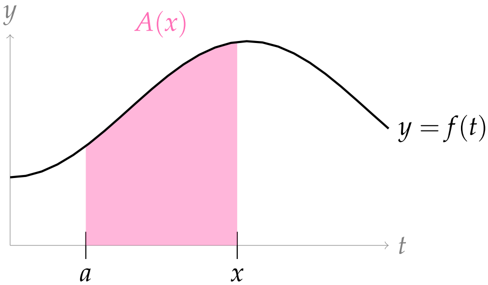
Question: Why is it true?

Derivative of Area Function, $A(x) = \int_a^x f(t)\mathrm{d}t$



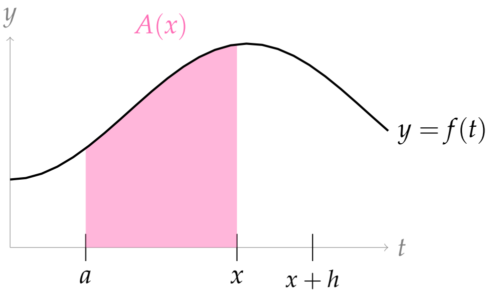
$$A'(x) = \lim_{\Delta x \to 0} \frac{\Delta A}{\Delta x} = \lim_{h \to 0} \frac{A(x+h) - A(x)}{h}$$

Derivative of Area Function, $A(x) = \int_a^x f(t)\mathrm{d}t$



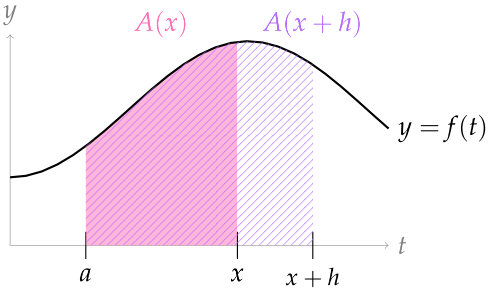
$$A'(x) = \lim_{\Delta x \to 0} \frac{\Delta A}{\Delta x} = \lim_{h \to 0} \frac{A(x+h) - A(x)}{h}$$

Derivative of Area Function, $A(x) = \int_a^x f(t)\mathrm{d}t$



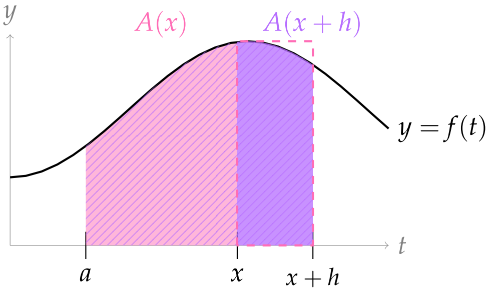
$$A'(x) = \lim_{\Delta x \to 0} \frac{\Delta A}{\Delta x} = \lim_{h \to 0} \frac{A(x+h) - A(x)}{h}$$

Derivative of Area Function, $A(x) = \int_a^x f(t)\mathrm{d}t$



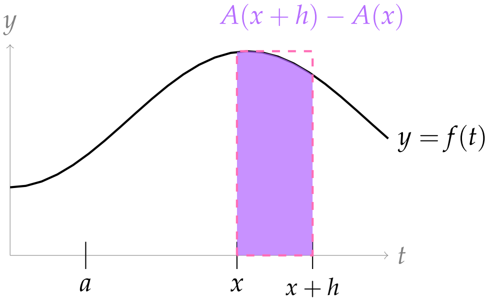
$$A'(x) = \lim_{\Delta x \to 0} \frac{\Delta A}{\Delta x} = \lim_{h \to 0} \frac{A(x+h) - A(x)}{h}$$

Derivative of Area Function, $A(x) = \int_a^x f(t)\mathrm{d}t$



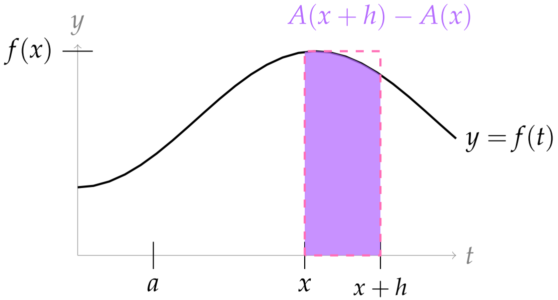
$$A'(x) = \lim_{\Delta x \to 0} \frac{\Delta A}{\Delta x} = \lim_{h \to 0} \frac{A(x+h) - A(x)}{h}$$

Derivative of Area Function, $A(x) = \int_a^x f(t)\mathrm{d}t$



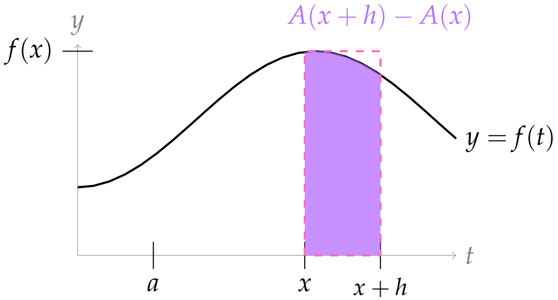
$$A'(x) = \lim_{\Delta x \to 0} \frac{\Delta A}{\Delta x} = \lim_{h \to 0} \frac{A(x+h) - A(x)}{h}$$

Derivative of Area Function, $A(x) = \int_a^x f(t)\mathrm{d}t$



$$A'(x) = \lim_{\Delta x \to 0} \frac{\Delta A}{\Delta x} = \lim_{h \to 0} \frac{A(x+h) - A(x)}{h} = \lim_{h \to 0} \frac{hf(x)}{h}$$

Derivative of Area Function, $A(x) = \int_a^x f(t)\mathrm{d}t$



$$A'(x) = \lim_{\Delta x \to 0} \frac{\Delta A}{\Delta x} = \lim_{h \to 0} \frac{A(x+h) - A(x)}{h} = \lim_{h \to 0} \frac{hf(x)}{h} = f(x)$$

When h is very small, the purple area looks like a rectangle with base h and height $f(x)$, so $A(x+h) - A(x) \approx hf(x)$ and $\frac{A(x+h)-A(x)}{h} \approx f(x)$. As h tends to zero, the error in this approximation approaches 0.

Fundamental Theorem of Calculus, Part 1

Let $a < b$ and let $f(x)$ be a function which is defined and continuous on $[a, b]$. Let

$$A(x) = \int_a^x f(t)\,\mathrm{d}t$$

for any x in $[a, b]$. Then the function $A(x)$ is differentiable and

$$A'(x) = f(x)\ .$$

Suppose $A(x) = \int_2^x \sin t\,\mathrm{d}t$. What is $A'(x)$?

Fundamental Theorem of Calculus, Part 1

Let $a < b$ and let $f(x)$ be a function which is defined and continuous on $[a, b]$. Let

$$A(x) = \int_a^x f(t)\,\mathrm{d}t$$

for any x in $[a, b]$. Then the function $A(x)$ is differentiable and

$$A'(x) = f(x)\ .$$

Suppose $A(x) = \int_2^x \sin t\,\mathrm{d}t$. What is $A'(x)$?

Suppose $B(x) = \int_x^2 \sin t\,\mathrm{d}t$. What is $B'(x)$?

Fundamental Theorem of Calculus, Part 1

Let $a < b$ and let $f(x)$ be a function which is defined and continuous on $[a, b]$. Let

$$A(x) = \int_a^x f(t)\,\mathrm{d}t$$

for any x in $[a, b]$. Then the function $A(x)$ is differentiable and

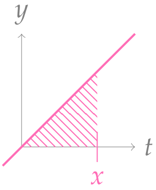
$$A'(x) = f(x)\ .$$

Suppose $C(x) = \int_2^{e^x} \sin t\,\mathrm{d}t$. What is $C'(x)$?

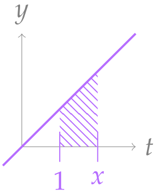
Q

It's possible to have two different functions with the same derivative.

$A(x) = \int_0^x 2t\,\mathrm{d}t$

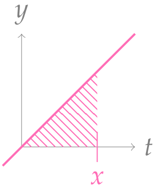


$B(x) = \int_1^x 2t\,\mathrm{d}t$



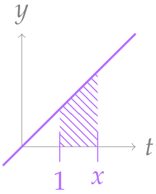
It's possible to have two different functions with the same derivative.

$A(x) = \int_0^x 2t \, \mathrm{d}t$



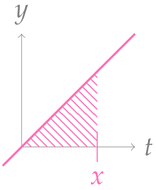
$A'(x) = 2x$

$B(x) = \int_1^x 2t \, \mathrm{d}t$



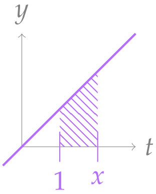
It's possible to have two different functions with the same derivative.

$A(x) = \int_0^x 2t \, \mathrm{d}t$



$A'(x) = 2x$

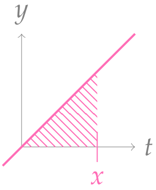
$B(x) = \int_1^x 2t \, \mathrm{d}t$



$B'(x) = 2x$

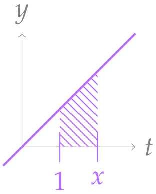
It's possible to have two different functions with the same derivative.

$A(x) = \int_0^x 2t\,\mathrm{d}t = x^2$



$A'(x) = 2x$

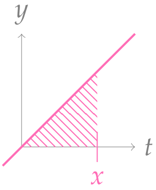
$B(x) = \int_1^x 2t\,\mathrm{d}t$



$B'(x) = 2x$

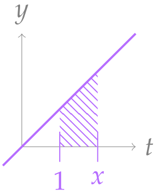
It's possible to have two different functions with the same derivative.

$A(x) = \int_0^x 2t \, \mathrm{d}t = x^2$



$A'(x) = 2x$

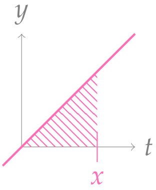
$B(x) = \int_1^x 2t \, \mathrm{d}t = x^2 - 1$



$B'(x) = 2x$

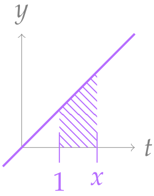
It's possible to have two different functions with the same derivative.

$A(x) = \int_0^x 2t\,\mathrm{d}t = x^2$



$A'(x) = 2x$

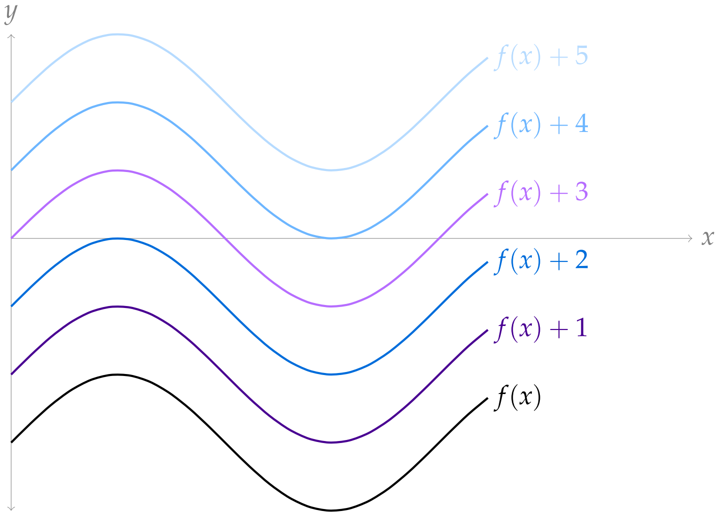
$B(x) = \int_1^x 2t\,\mathrm{d}t = x^2 - 1$



$B'(x) = 2x$

When two functions have the same derivative, they differ only by a constant.

In this example: $B(x) = A(x) - 1$



If two continuous functions have the same derivative, then one is a constant plus the other.

Two clues for finding $A(x) = \int_a^x f(t)\,\mathrm{d}t$:

- If $A(x) = \displaystyle\int_a^x f(t)\,\mathrm{d}t$, then[1] $A'(x) = f(x)$
- If $F'(x) = A'(x)$, then $A(x) = F(x) + C$ for some constant C.

[1](as long as $f(t)$ is continuous on $[a, x]$)

Two clues for finding $A(x) = \int_a^x f(t)\,\mathrm{d}t$:

- If $A(x) = \displaystyle\int_a^x f(t)\,\mathrm{d}t$, then[1] $A'(x) = f(x)$
- If $F'(x) = A'(x)$, then $A(x) = F(x) + C$ for some constant C.

$A(x) = \displaystyle\int_a^x e^t\,\mathrm{d}t$. What functions could $A(x)$ be?

[1](as long as $f(t)$ is continuous on $[a, x]$)

Two clues for finding $A(x) = \int_a^x f(t)\,\mathrm{d}t$:

- If $A(x) = \displaystyle\int_a^x f(t)\,\mathrm{d}t$, then[1] $A'(x) = f(x)$
- If $F'(x) = A'(x)$, then $A(x) = F(x) + C$ for some constant C.

$A(x) = \displaystyle\int_a^x \cos t\,\mathrm{d}t$. What functions could $A(x)$ be?

[1](as long as $f(t)$ is continuous on $[a, x]$)

Two clues for finding $A(x) = \int_a^x f(t)\,\mathrm{d}t$:

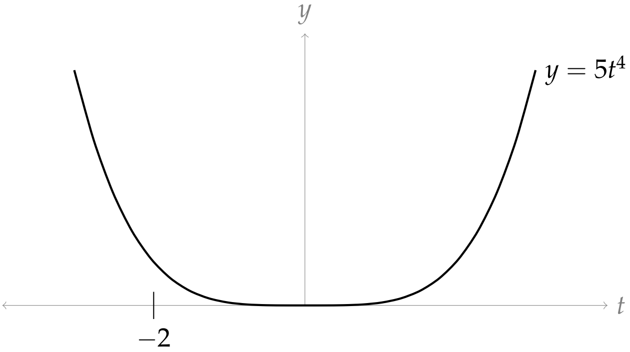
- If $A(x) = \displaystyle\int_a^x f(t)\,\mathrm{d}t$, then[1] $A'(x) = f(x)$
- If $F'(x) = A'(x)$, then $A(x) = F(x) + C$ for some constant C.

$A(x) = \displaystyle\int_{-2}^x 5t^4\,\mathrm{d}t$. What functions could $A(x)$ be?

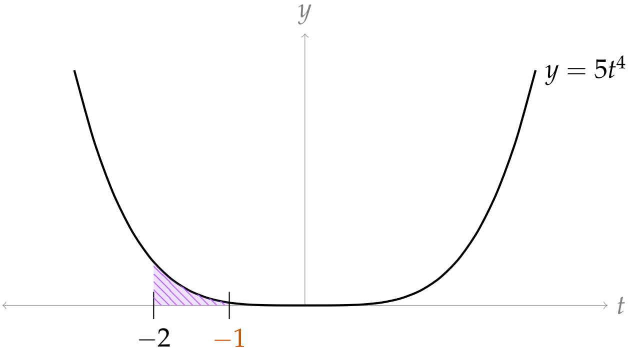
[1](as long as $f(t)$ is continuous on $[a, x]$)

Q

$$A(x) = \int_{-2}^{x} 5t^4 \, \mathrm{d}t = x^5 + 32$$

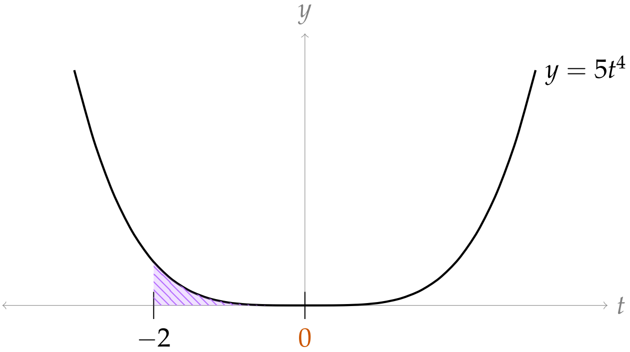


$$A(x) = \int_{-2}^{x} 5t^4 \, \mathrm{d}t = x^5 + 32$$



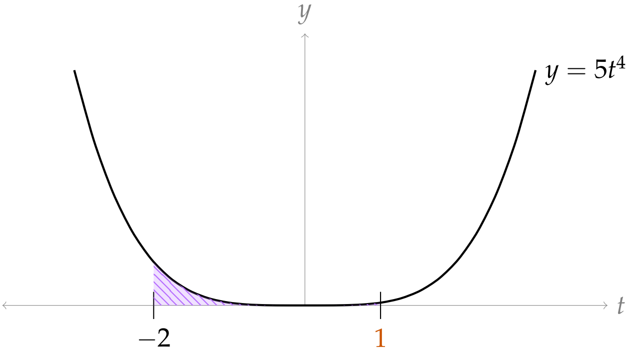
$$A(-1) = \int_{-2}^{-1} 5t^4 \, \mathrm{d}t = (-1)^5 + 32 = 31$$

$$A(x) = \int_{-2}^{x} 5t^4 \, \mathrm{d}t = x^5 + 32$$



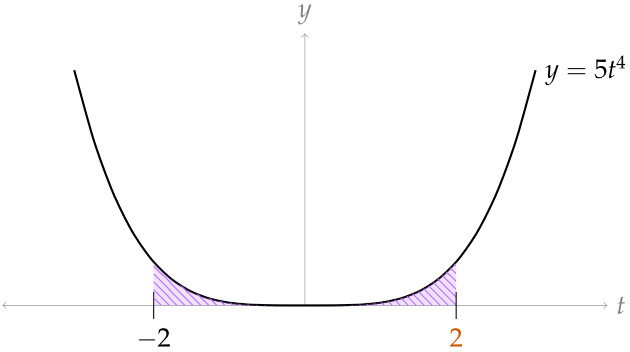
$$A(0) = \int_{-2}^{0} 5t^4 \, \mathrm{d}t = (0)^5 + 32 = 32$$

$$A(x) = \int_{-2}^{x} 5t^4 \, \mathrm{d}t = x^5 + 32$$



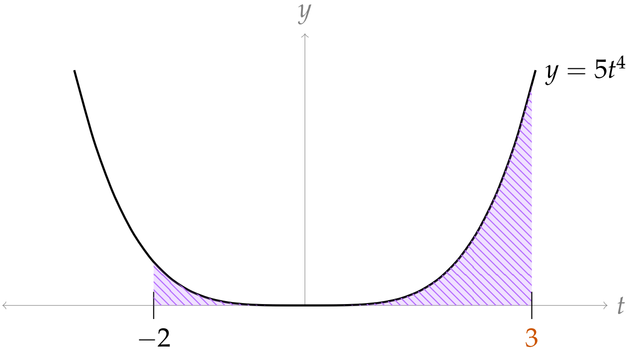
$$A(1) = \int_{-2}^{1} 5t^4 \, \mathrm{d}t = (1)^5 + 32 = 33$$

$$A(x) = \int_{-2}^{x} 5t^4 \, \mathrm{d}t = x^5 + 32$$



$$A(2) = \int_{-2}^{2} 5t^4 \, \mathrm{d}t = (2)^5 + 32 = 64$$

$$A(x) = \int_{-2}^{x} 5t^4 \, dt = x^5 + 32$$



$$A(3) = \int_{-2}^{3} 5t^4 \, dt = (3)^5 + 32 = 275$$

Two clues for finding $A(x) = \int_a^x f(t)\,\mathrm{d}t$:

- If $A(x) = \displaystyle\int_a^x f(t)\,\mathrm{d}t$, then[1] $A'(x) = f(x)$
- If $F'(x) = A'(x)$, then $A(x) = F(x) + C$ for some constant C.

$A(x) = \displaystyle\int_a^x f(t)\,\mathrm{d}t$. What functions could $A(x)$ be?

[1] (as long as $f(t)$ is continuous on $[a, x]$)

Two clues for finding $A(x) = \int_a^x f(t)\,dt$:

- If $A(x) = \displaystyle\int_a^x f(t)\,dt$, then[1] $A'(x) = f(x)$
- If $F'(x) = A'(x)$, then $A(x) = F(x) + C$ for some constant C.

$A(x) = \displaystyle\int_a^x f(t)\,dt$. What functions could $A(x)$ be?

- $A'(x) = f(x)$.
- Guess a function with derivative $f(x)$: $F(x)$.
- Then $A(x) = F(x) + C$ for some constant C.
- Also $A(a) = 0$, so $0 = F(a) + C$, so $C = -F(a)$
- So, $A(x) = F(x) - F(a)$

[1](as long as $f(t)$ is continuous on $[a, x]$)

Two clues for finding $A(x) = \int_a^x f(t)\,\mathrm{d}t$:

- If $A(x) = \displaystyle\int_a^x f(t)\,\mathrm{d}t$, then[1] $A'(x) = f(x)$
- If $F'(x) = A'(x)$, then $A(x) = F(x) + C$ for some constant C.

$A(x) = \displaystyle\int_a^x f(t)\,\mathrm{d}t$. What functions could $A(x)$ be?

- $A'(x) = f(x)$.
- Guess a function with derivative $f(x)$: $F(x)$.
- Then $A(x) = F(x) + C$ for some constant C.
- Also $A(a) = 0$, so $0 = F(a) + C$, so $C = -F(a)$
- So, $A(x) = F(x) - F(a)$

[1](as long as $f(t)$ is continuous on $[a, x]$)

Two clues for finding $A(x) = \int_a^x f(t)\,\mathrm{d}t$:

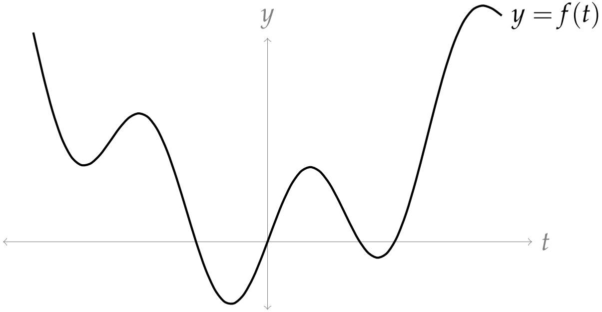
- If $A(x) = \displaystyle\int_a^x f(t)\,\mathrm{d}t$, then[1] $A'(x) = f(x)$
- If $F'(x) = A'(x)$, then $A(x) = F(x) + C$ for some constant C.

$A(b) = \displaystyle\int_a^b f(t)\,\mathrm{d}t$. What functions could $A(b)$ be?

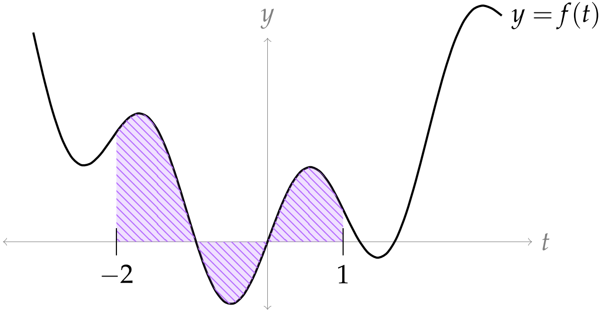
- $A'(x) = f(x)$.
- Guess a function with derivative $f(x)$: $F(x)$.
- Then $A(x) = F(x) + C$ for some constant C.
- Also $A(a) = 0$, so $0 = F(a) + C$, so $C = -F(a)$
- So, $A(b) = F(b) - F(a)$

[1](as long as $f(t)$ is continuous on $[a, x]$)

$$\int_a^b f(t)\,\mathrm{d}t = F(b) - F(a) \quad \text{where} \quad F'(x) = f(x)$$

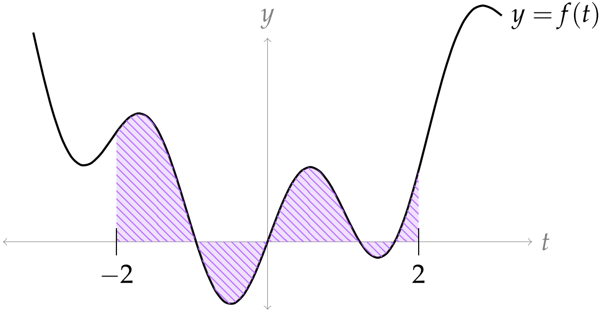


$$\int_a^b f(t)\,\mathrm{d}t = F(b) - F(a) \quad \text{where} \quad F'(x) = f(x)$$



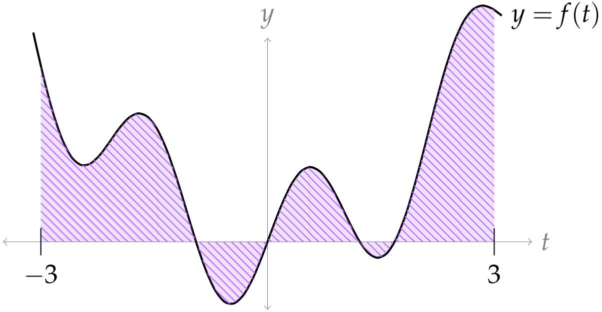
$$\int_{-2}^{1} f(t)\,\mathrm{d}t = F(1) - F(-2)$$

$$\int_a^b f(t)\,\mathrm{d}t = F(b) - F(a) \quad \text{where} \quad F'(x) = f(x)$$



$$\int_{-2}^{2} f(t)\,\mathrm{d}t = F(2) - F(-2)$$

$$\int_a^b f(t)\,\mathrm{d}t = F(b) - F(a) \quad \text{where} \quad F'(x) = f(x)$$



$$\int_{-3}^{3} f(t)\,\mathrm{d}t = F(3) - F(-3)$$

Fundamental Theorem of Calculus, Part 2

Let $F(x)$ be differentiable, defined, and continuous on the interval $[a, b]$ with $F'(x) = f(x)$ for all $a < x < b$. Then

$$\int_a^b f(x)\,\mathrm{d}x = F(b) - F(a)$$

Fundamental Theorem of Calculus, Part 2

Let $F(x)$ be differentiable, defined, and continuous on the interval $[a, b]$ with $F'(x) = f(x)$ for all $a < x < b$. Then

$$\int_a^b f(x)\,\mathrm{d}x = F(b) - F(a)$$

Examples:

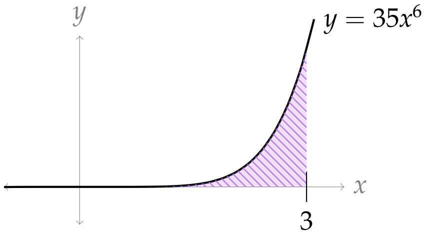
$\frac{\mathrm{d}}{\mathrm{d}x}\left\{5x^7\right\} = 35x^6$, so

$$\int_0^3 35x^6\,\mathrm{d}x =$$

$\frac{\mathrm{d}}{\mathrm{d}x}\left\{\tan x\right\} = \sec^2 x$, so

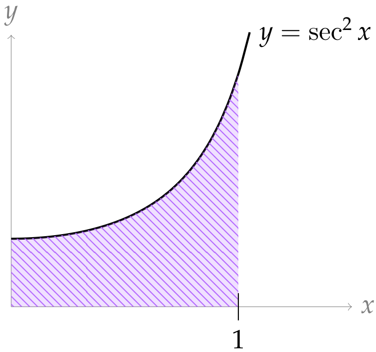
$$\int_0^{\pi/4} \sec^2 x\,\mathrm{d}x =$$

$$\int_0^3 35x^6\,\mathrm{d}x = F(b) - F(a) \quad \text{where} \quad F(x) = 5x^7$$



$$\int_0^3 35x^6\,\mathrm{d}x = 5(3)^7 - 5(0)^7$$

$$\int_0^{\pi/4} \sec^2 x \, dx = F(b) - F(a) \quad \textbf{where} \quad F(x) = \tan x$$



$$\int_0^{\pi/4} \sec^2 x \, dx = \tan\left(\frac{\pi}{4}\right) - \tan 0 = 1$$

Relevant Vocabulary

Examples:
The derivative of x^2 is $2x$, so:
x^2 is an **antiderivative** of $2x$.

When $x > 0$, the derivative of $\log x$ is $\frac{1}{x}$, so:

For all x, the derivative of $\log |x|$ is $\frac{1}{x}$, so:

Relevant Vocabulary

Definition

If $F(x)$ is a function whose derivative is $f(x)$, we call $F(x)$ an **antiderivative** of $f(x)$.

Examples:
The derivative of x^2 is $2x$, so:
x^2 is an **antiderivative** of $2x$.

When $x > 0$, the derivative of $\log x$ is $\frac{1}{x}$, so:

For all x, the derivative of $\log |x|$ is $\frac{1}{x}$, so:

An antiderivative of $\sin x$ is

Q

Convenient Notation

Definition

$$f(x)\Big|_a^b = f(b) - f(a)$$

The function $f(x)$ evaluated from a to b

Convenient Notation

Definition

$$f(x)\Big|_a^b = f(b) - f(a)$$

The function $f(x)$ evaluated from a to b

Examples:

$$(5x + x^2)\Big|_1^2 =$$

Convenient Notation

Definition

$$f(x)\Big|_a^b = f(b) - f(a)$$

The function $f(x)$ evaluated from a to b

Examples:

$$(5x + x^2)\Big|_1^2 =$$

$$\frac{x^2}{x+2}\Big|_5^{-1} =$$

Convenient Notation

Definition

$$f(x)\Big|_a^b = f(b) - f(a)$$

The function $f(x)$ evaluated from a to b

FTC Part 2, Abridged

$$\int_a^b f(x)\,\mathrm{d}x = F(x)\Big|_a^b$$

where $F(x)$ is an antiderivative of $f(x)$

Definition

The **indefinite integral** of a function $f(x)$:

$$\int f(x)\,\mathrm{d}x$$

means the *most general* antiderivative of $f(x)$.

Examples:

$$\int 2x\,\mathrm{d}x =$$

Definition

The **indefinite integral** of a function $f(x)$:

$$\int f(x)\,\mathrm{d}x$$

means the *most general* antiderivative of $f(x)$.

Examples:

$$\int 2x\,\mathrm{d}x =$$

$$\int \frac{1}{x}\,\mathrm{d}x =$$

Remember: two functions with the same derivative differ by a constant, so we include the "$+C$" for indefinite integrals.

Q

Definite vs Indefinite Integrals

For each pair of properties below, decide which applies to **definite** integrals, and which to **indefinite** integrals.

No limits (or bounds) of integration, $\int f(x)\,\mathrm{d}x$ Limits (or bounds) of integration, $\int_a^b f(x)\,\mathrm{d}x$	
Area under a curve Antiderivative	
Number Function	

Antidifferentiation by Inspection

1. $\int e^x \, \mathrm{d}x$

Antidifferentiation by Inspection

1. $\displaystyle\int e^x \, \mathrm{d}x$
2. $\displaystyle\int \cos x \, \mathrm{d}x$

Antidifferentiation by Inspection

1. $\displaystyle\int e^x \, \mathrm{d}x$
2. $\displaystyle\int \cos x \, \mathrm{d}x$
3. $\displaystyle\int -\sin x \, \mathrm{d}x$

Antidifferentiation by Inspection

1. $\displaystyle\int e^x \,\mathrm{d}x$
2. $\displaystyle\int \cos x \,\mathrm{d}x$
3. $\displaystyle\int -\sin x \,\mathrm{d}x$
4. $\displaystyle\int \frac{1}{x} \,\mathrm{d}x$

Antidifferentiation by Inspection

1. $\int e^x \, \mathrm{d}x$
2. $\int \cos x \, \mathrm{d}x$
3. $\int -\sin x \, \mathrm{d}x$
4. $\int \frac{1}{x} \, \mathrm{d}x$
5. $\int 1 \, \mathrm{d}x$

Q

Antidifferentiation by Inspection

1. $\displaystyle\int e^x \,\mathrm{d}x$
2. $\displaystyle\int \cos x \,\mathrm{d}x$
3. $\displaystyle\int -\sin x \,\mathrm{d}x$
4. $\displaystyle\int \frac{1}{x} \,\mathrm{d}x$
5. $\displaystyle\int 1 \,\mathrm{d}x$
6. $\displaystyle\int 2x \,\mathrm{d}x$

Q

Antidifferentiation by Inspection

1. $\displaystyle\int e^x \, \mathrm{d}x$
2. $\displaystyle\int \cos x \, \mathrm{d}x$
3. $\displaystyle\int -\sin x \, \mathrm{d}x$
4. $\displaystyle\int \frac{1}{x} \, \mathrm{d}x$
5. $\displaystyle\int 1 \, \mathrm{d}x$
6. $\displaystyle\int 2x \, \mathrm{d}x$
7. $\displaystyle\int nx^{n-1} \, \mathrm{d}x \qquad (n \neq 0, \text{constant})$

Q

Antidifferentiation by Inspection

1. $\displaystyle\int e^x \, \mathrm{d}x$
2. $\displaystyle\int \cos x \, \mathrm{d}x$
3. $\displaystyle\int -\sin x \, \mathrm{d}x$
4. $\displaystyle\int \frac{1}{x} \, \mathrm{d}x$
5. $\displaystyle\int 1 \, \mathrm{d}x$
6. $\displaystyle\int 2x \, \mathrm{d}x$
7. $\displaystyle\int nx^{n-1} \, \mathrm{d}x \qquad (n \neq 0, \text{constant})$
8. $\displaystyle\int x^n \, \mathrm{d}x \qquad (n \neq -1, \text{constant})$

Power Rule for Antidifferentiation

$$\int x^n \, \mathrm{d}x = \frac{1}{n+1} x^{n+1} + C$$

if $n \neq -1$ is a constant

Example:

$$\int \left(5x^2 - 15x + 3\right) \, \mathrm{d}x =$$

Antiderivatives to Recognize

- $\int x^n \, \mathrm{d}x = \frac{1}{n+1}x^{n+1} + C$
- $\int a \, \mathrm{d}x = ax + C$
- $\int e^x \, \mathrm{d}x = e^x + C$
- $\int \frac{1}{x} \, \mathrm{d}x = \log|x| + C$
- $\int \sin x \, \mathrm{d}x = -\cos x + C$
- $\int \cos x \, \mathrm{d}x = \sin x + C$
- $\int \sec^2 x \, \mathrm{d}x = \tan x + C$
- $\int \sec x \tan x \, \mathrm{d}x = \sec x + C$
- $\int \csc x \cot x \, \mathrm{d}x = -\csc x + C$
- $\int \csc^2 x \, \mathrm{d}x = -\cot x + C$
- $\int \frac{1}{1+x^2} \, \mathrm{d}x = \arctan x + C$
- $\int \frac{1}{\sqrt{1-x^2}} \, \mathrm{d}x = \arcsin x + C$
