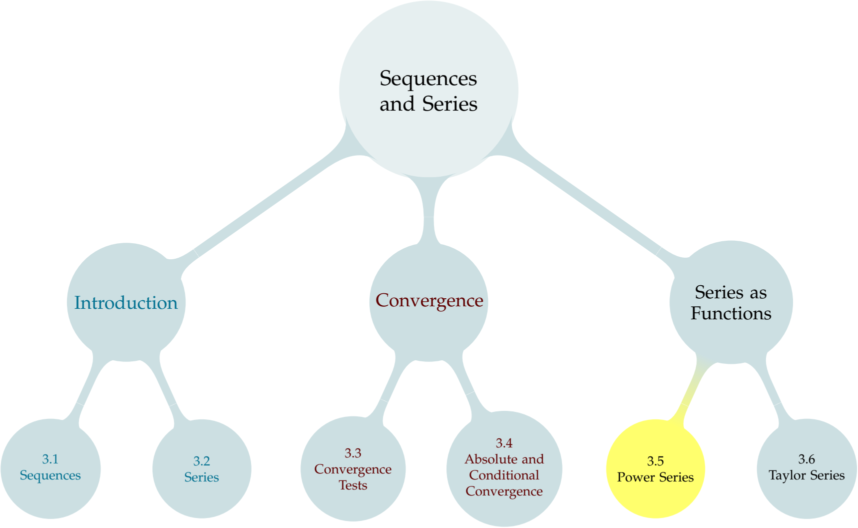
Table of Contents



Recall the geometric series: for a constant r, with $|r| < 1$:

$$\sum_{n=0}^{\infty} r^n = \frac{1}{1-r}$$

We can think of this as a function. If we set

$$f(x) = \sum_{n=0}^{\infty} x^n$$

and restrict our domain to $-1 < x < 1$, then

$$f(x) = \sum_{n=0}^{\infty} x^n = \frac{1}{1-x}$$

Definition

A series of the form

$$\sum_{n=0}^{\infty} A_n(x-c)^n = A_0 + A_1(x-c) + A_2(x-c)^2 + A_3(x-c)^3 + \cdots$$

is called a *power series in* $(x-c)$ or a *power series centered on* c. The numbers A_n are called the coefficients of the power series.

One often considers power series centered on $c = 0$ and then the series reduces to

$$A_0 + A_1x + A_2x^2 + A_3x^3 + \cdots = \sum_{n=0}^{\infty} A_n x^n$$

$$\sum_{n=0}^{\infty} A_n(x-c)^n = A_0 + A_1(x-c) + A_2(x-c)^2 + A_3(x-c)^3 + \cdots$$

In a power series, we think of the coefficients A_n as fixed constants, and we think of x as the variable of a function.

$$\sum_{n=0}^{\infty} A_n(x-c)^n = A_0 + A_1(x-c) + A_2(x-c)^2 + A_3(x-c)^3 + \cdots$$

In a power series, we think of the coefficients A_n as fixed constants, and we think of x as the variable of a function.

Evaluate the power series $\sum\limits_{n=0}^{\infty} A_n(x-c)^n$ when $x = c$:

A fundamental question we want to ask when we see a series is whether it converges or diverges. So, let's find all values of x for which the power series

$$\sum_{n=1}^{\infty} \frac{x^n}{n} = x + \frac{x^2}{2} + \frac{x^3}{3} + \frac{x^4}{4} + \cdots$$

converges.

A fundamental question we want to ask when we see a series is whether it converges or diverges. So, let's find all values of x for which the power series

$$\sum_{n=1}^{\infty} \frac{x^n}{n} = x + \frac{x^2}{2} + \frac{x^3}{3} + \frac{x^4}{4} + \cdots$$

converges.

Definition

Consider the power series

$$\sum_{n=0}^{\infty} A_n (x-c)^n.$$

The set of real x-values for which it converges is called the interval of convergence of the series.

Find the interval of convergence of the power series

$$\sum_{n=0}^{\infty} 2^n (x-1)^n = 1 + 2(x-1) + 2^2(x-1)^2 + 2^3(x-1)^3 + \cdots .$$

Q

What happens if we apply the ratio test to a generic power series, $\sum\limits_{n=0}^{\infty} A_n(x-c)^n$?

What happens if we apply the ratio test to a generic power series, $\sum_{n=0}^{\infty} A_n(x-c)^n$?

$$\lim_{n\to\infty}\left|\frac{A_{n+1}(x-c)^{n+1}}{A_n(x-c)^n}\right| = \lim_{n\to\infty}\left|\frac{A_{n+1}}{A_n}(x-c)\right| = |x-c|\lim_{n\to\infty}\left|\frac{A_{n+1}}{A_n}\right|$$

- If $\left|\frac{A_{n+1}}{A_n}\right|$ does not approach a limit as $n\to\infty$, the ratio test tells us nothing. (We should try other tests.)
- If $\lim\limits_{n\to\infty}\left|\frac{A_{n+1}}{A_n}\right| = 0$, then
- If $\lim\limits_{n\to\infty}\left|\frac{A_{n+1}}{A_n}\right| = \infty$, then
- If $\lim\limits_{n\to\infty}\left|\frac{A_{n+1}}{A_n}\right| = A$ for some real number A, then

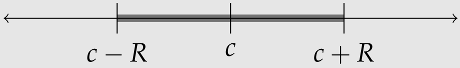
What happens if we apply the ratio test to a generic power series, $\sum_{n=0}^{\infty} A_n(x-c)^n$?

$$\lim_{n\to\infty}\left|\frac{A_{n+1}(x-c)^{n+1}}{A_n(x-c)^n}\right| = \lim_{n\to\infty}\left|\frac{A_{n+1}}{A_n}(x-c)\right| = |x-c|\lim_{n\to\infty}\left|\frac{A_{n+1}}{A_n}\right|$$

- If $\left|\frac{A_{n+1}}{A_n}\right|$ does not approach a limit as $n\to\infty$, the ratio test tells us nothing. (We should try other tests.)
- If $\lim\limits_{n\to\infty}\left|\frac{A_{n+1}}{A_n}\right| = 0$, then the series converges for all x.
- If $\lim\limits_{n\to\infty}\left|\frac{A_{n+1}}{A_n}\right| = \infty$, then the series converges when $x = c$, and diverges otherwise.
- If $\lim\limits_{n\to\infty}\left|\frac{A_{n+1}}{A_n}\right| = A$ for some real number A, then the series converges when $|x-c| < \frac{1}{A}$, and diverges for $|x-c| > \frac{1}{A}$. The cases $|x-c| = \frac{1}{A}$ need further inspection.

Definition: Radius of Convergence

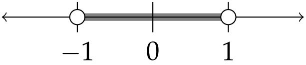
(a) Let $0 < R < \infty$. If $\sum\limits_{n=0}^{\infty} A_n(x-c)^n$ converges for $|x-c| < R$, and diverges for $|x-c| > R$, then we say that the series has radius of convergence R.



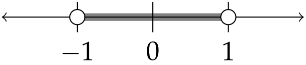
(b) If $\sum_{n=0}^{\infty} A_n(x-c)^n$ converges for every number x, we say that the series has an infinite radius of convergence.

(c) If $\sum_{n=0}^{\infty} A_n(x-c)^n$ diverges for every $x \neq c$, we say that the series has radius of convergence zero.

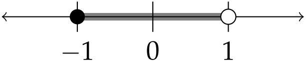
- We saw that $\sum_{n=0}^{\infty} x^n$ converges when $|x| < 1$ and diverges when $|x| > 1$, so this series has radius of convergence $R =$



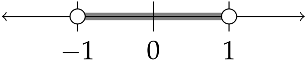
- We saw that $\sum_{n=0}^{\infty} x^n$ converges when $|x| < 1$ and diverges when $|x| > 1$, so this series has radius of convergence $R = 1$.



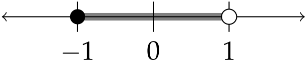
- We saw that $\sum_{n=1}^{\infty} \frac{x^n}{n}$ converges when $|x| < 1$ and diverges when $|x| > 1$, so this series also has radius of convergence $R =$



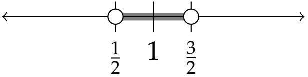
- We saw that $\sum_{n=0}^{\infty} x^n$ converges when $|x| < 1$ and diverges when $|x| > 1$, so this series has radius of convergence $R = 1$.



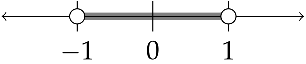
- We saw that $\sum_{n=1}^{\infty} \frac{x^n}{n}$ converges when $|x| < 1$ and diverges when $|x| > 1$, so this series also has radius of convergence $R = 1$.



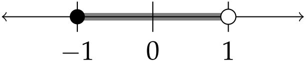
- We saw that $\sum_{n=1}^{\infty} 2^n (x-1)^n$ converges when $|x - 1| < \frac{1}{2}$ and diverges when $|x - 1| > \frac{1}{2}$, so this series has radius of convergence $R =$



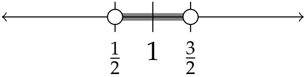
- We saw that $\sum_{n=0}^{\infty} x^n$ converges when $|x| < 1$ and diverges when $|x| > 1$, so this series has radius of convergence $R = 1$.



- We saw that $\sum_{n=1}^{\infty} \frac{x^n}{n}$ converges when $|x| < 1$ and diverges when $|x| > 1$, so this series also has radius of convergence $R = 1$.



- We saw that $\sum_{n=1}^{\infty} 2^n(x-1)^n$ converges when $|x-1| < \frac{1}{2}$ and diverges when $|x-1| > \frac{1}{2}$, so this series has radius of convergence $R = \frac{1}{2}$.



What is the radius of convergence for the series $\sum_{n=0}^{\infty} \frac{x^n}{n!}$?

Recall: $n! = (n)(n-1)(n-2)\cdots(2)(1)$.

What is the radius of convergence for the series $\sum_{n=0}^{\infty} n! \cdot (x-3)^n$?

Q

Theorem

Given a power series (say with centre c), one of the following holds.

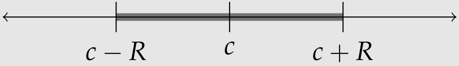
(a) The power series converges for every number x. In this case we say that the radius of convergence is ∞.

Theorem

Given a power series (say with centre c), one of the following holds.

(a) The power series converges for every number x. In this case we say that the radius of convergence is ∞.

(b) There is a number $0 < R < \infty$ such that the series converges for $|x - c| < R$ and diverges for $|x - c| > R$. Then R is called the radius of convergence.



Theorem

We are told that a certain power series with centre $c = 3$ converges at $x = 4$ and diverges at $x = 1$. What else can we say about the convergence or divergence of the series for other values of x?

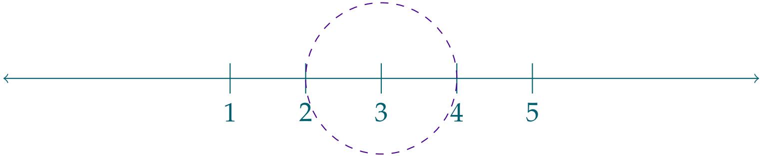
- From $R \geq 1$, we know
- From $R \leq 2$, we know
- We do not know whether the series converges for other x.

We are told that a certain power series with centre $c = 3$ converges at $x = 4$ and diverges at $x = 1$. What else can we say about the convergence or divergence of the series for other values of x?



Operations on Power Series

Assume that the functions $f(x)$ and $g(x)$ are given by the power series

$$f(x) = \sum_{n=0}^{\infty} A_n (x-c)^n \qquad g(x) = \sum_{n=0}^{\infty} B_n (x-c)^n$$

for all x obeying $|x-c| < R$. Let K be a constant. Then:

$$f(x) + g(x) = \sum_{n=0}^{\infty} [A_n + B_n]\,(x-c)^n$$

$$Kf(x) = \sum_{n=0}^{\infty} K\,A_n\,(x-c)^n$$

for all x obeying $|x-c| < R$.

Operations on Power Series

Assume that the functions $f(x)$ and $g(x)$ are given by the power series

$$f(x) = \sum_{n=0}^{\infty} A_n (x-c)^n \qquad g(x) = \sum_{n=0}^{\infty} B_n (x-c)^n$$

for all x obeying $|x-c| < R$. Then:

$$\begin{aligned} (x-c)^N f(x) &= \sum_{n=0}^{\infty} A_n\,(x-c)^{n+N} \quad \text{for any integer } N \geq 1 \\ &= \sum_{k=N}^{\infty} A_{k-N}\,(x-c)^k \quad \text{where } k = n+N \end{aligned}$$

for all x obeying $|x-c| < R$.

Operations on Power Series

Assume that the functions $f(x)$ and $g(x)$ are given by the power series

$$f(x) = \sum_{n=0}^{\infty} A_n (x-c)^n \qquad g(x) = \sum_{n=0}^{\infty} B_n (x-c)^n$$

for all x obeying $|x-c| < R$. Then:

$$f'(x) = \sum_{n=0}^{\infty} A_n\, n\, (x-c)^{n-1} = \sum_{n=1}^{\infty} A_n\, n\, (x-c)^{n-1}$$

$$\int_c^x f(t)\, \mathrm{d}t = \sum_{n=0}^{\infty} A_n \frac{(x-c)^{n+1}}{n+1}$$

$$\int f(x)\, \mathrm{d}x = \left[\sum_{n=0}^{\infty} A_n \frac{(x-c)^{n+1}}{n+1}\right] + C \quad \text{with } C \text{ an arbitrary constant}$$

for all x obeying $|x-c| < R$.

Operations on Power Series

Assume that the functions $f(x)$ and $g(x)$ are given by the power series

$$f(x) = \sum_{n=0}^{\infty} A_n (x-c)^n \qquad g(x) = \sum_{n=0}^{\infty} B_n (x-c)^n$$

for all x obeying $|x-c| < R$.

Differentiating, antidifferentiating, multiplying by a nonzero constant, and multiplying by a positive power of $(x-c)$ do not change the radius of convergence of $f(x)$ (although they may change the interval of convergence).

Given that $\dfrac{\mathrm{d}}{\mathrm{d}x}\left\{\dfrac{1}{1-x}\right\} = \dfrac{1}{(1-x)^2}$, find a power series representation for $\dfrac{1}{(1-x)^2}$ when $|x| < 1$.

Find a power series representation for $\log(1+x)$ when $|x| < 1$.

Find a power series representation for $\arctan(x)$ when $|x| < 1$.

Substituting in a Power Series

Assume that the function $f(x)$ is given by the power series

$$f(x) = \sum_{n=0}^{\infty} A_n x^n$$

for all x in the interval I. Also let K and k be real constants. Then

$$f\left(Kx^k\right) = \sum_{n=0}^{\infty} A_n K^n \, x^{kn}$$

whenever Kx^k is in I. In particular, if $\sum_{n=0}^{\infty} A_n x^n$ has radius of convergence R, K is nonzero and k is a natural number, then $\sum_{n=0}^{\infty} A_n K^n \, x^{kn}$ has radius of convergence $\sqrt[k]{R/|K|}$.

Find a power series representation for $\dfrac{1}{5-x}$ with centre 3.
