## TABLE OF CONTENTS

We defined the definite integral using a limit and a sum.

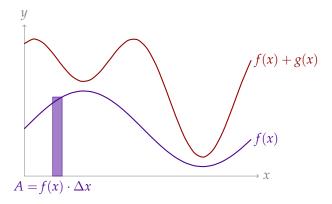

#### Definition

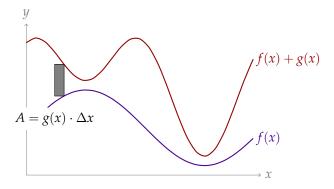

Let *a* and *b* be two real numbers and let f(x) be a function that is defined for all *x* between *a* and *b*. Then we define  $\Delta x = \frac{b-a}{N}$  and

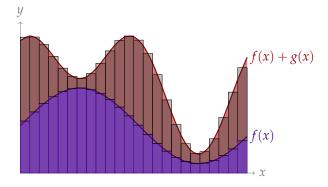

$$\int_{a}^{b} f(x) dx = \lim_{N \to \infty} \sum_{i=1}^{N} f(x_{i,N}^{*}) \cdot \Delta x$$

when the limit exists and when the choice of  $x_{i,N}^*$  in the i<sup>th</sup> interval doesn't matter.

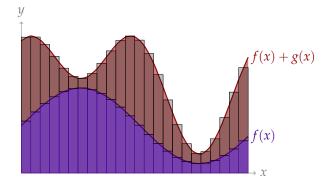

Many of the operations that work nicely with sums and limits will also work nicely with integrals.

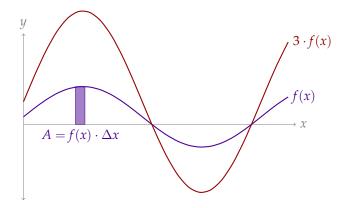

$$\int_a^b (f(x) + g(x)) dx = \int_a^b f(x) dx + \int_a^b g(x) dx$$

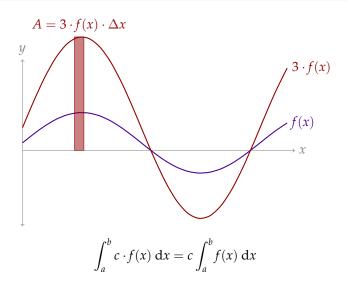

$$\int_a^b (f(x) - g(x)) dx = \int_a^b f(x) dx - \int_a^b g(x) dx$$

## MULTIPLYING A FUNCTION BY A CONSTANT

## MULTIPLYING A FUNCTION BY A CONSTANT

## **ARITHMETIC OF INTEGRATION**

When a, b, and c are real numbers, and the functions f(x) and g(x) are integrable on an interval containing a and b:

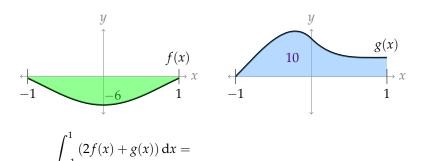

(a) 
$$\int_{a}^{b} [f(x) + g(x)] dx = \int_{a}^{b} f(x) dx + \int_{a}^{b} g(x) dx$$

(b) 
$$\int_{a}^{b} [f(x) - g(x)] dx = \int_{a}^{b} f(x) dx - \int_{a}^{b} g(x) dx$$

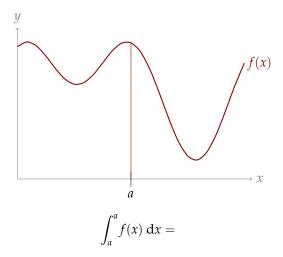

(c) 
$$\int_a^b c \cdot f(x) dx = c \int_a^b f(x) dx$$
 when *c* is constant

## ARITHMETIC OF INTEGRATION

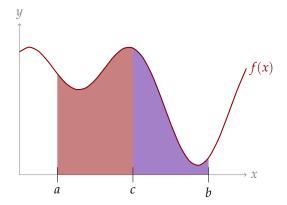

Suppose 
$$\int_{-1}^{1} f(x) dx = -6$$
 and  $\int_{-1}^{1} g(x) dx = 10$ .

## INTERVAL OF INTEGRATION

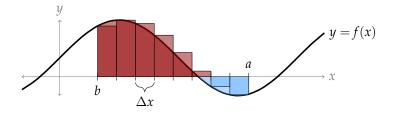

## INTERVAL OF INTEGRATION

What rule do you think is being illustrated?

# What happens in $\int_a^b f(x) \, dx$ when b < a?

$$\int_{a}^{b} f(x) dx = \lim_{n \to \infty} \sum_{i=1}^{n} f(x_{i,n}^{*}) \cdot \frac{b-a}{n}$$

This is the definition of a definite integral *whether or not a* < b.

#### PROPERTY OF DEFINITE INTEGRALS

$$\int_{a}^{b} f(x) \, \mathrm{d}x = -\int_{b}^{a} f(x) \, \mathrm{d}x$$

As strictly a measure of area, not usually a super useful fact – but helps later when we do arithmetic with integrals.

It's also useful that the definition works without having to worry about which limit of integration (*a* or *b*) is larger.

#### ARITHMETIC FOR DOMAIN OF INTEGRATION

When a, b, and c are constants, and f(x) is integrable over a domain containing all three:

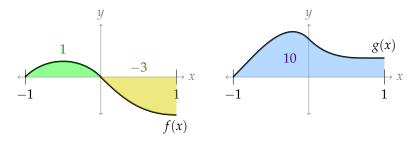

(a) 
$$\int_{a}^{a} f(x) \, \mathrm{d}x = 0$$

(b) 
$$\int_a^b f(x) \, dx = -\int_b^a f(x) \, dx \qquad \Delta x = \frac{b-a}{n} = -\frac{a-b}{n}$$

(c) 
$$\int_{a}^{b} f(x) dx = \int_{a}^{c} f(x) dx + \int_{c}^{b} f(x) dx \text{ for constant } c$$

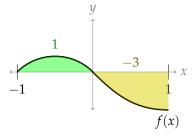

Suppose  $\int_{-1}^{0} f(x) dx = 1$ ,  $\int_{0}^{1} f(x) dx = -3$ , and  $\int_{-1}^{1} g(x) dx = 10$ .

$$\int_{-1}^{1} (2f(x) + g(x)) \, \mathrm{d}x =$$

Suppose 
$$\int_{-1}^{0} f(x) dx = 1$$
 and  $\int_{0}^{1} f(x) dx = -3$ .

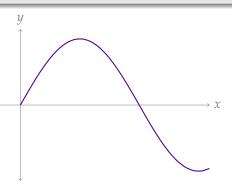

$$\int_{-1}^{3} f(x) \, \mathrm{d}x + \int_{3}^{0} f(x) \, \mathrm{d}x =$$

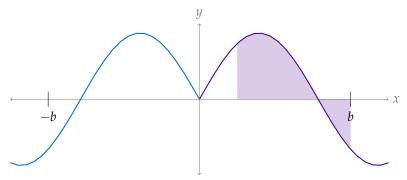

## Even and Odd Functions

Let f(x) be a function.

- We say f(x) is even when f(x) = f(-x) for all x, and
- we say f(x) is odd when f(x) = -f(-x) for all x.

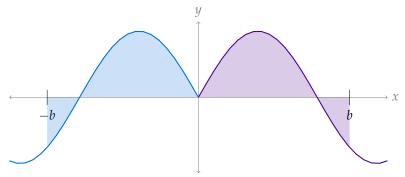

## INTEGRALS OF EVEN FUNCTIONS

Suppose f(x) is even. Then

$$\int_a^b f(x) \, \mathrm{d}x =$$

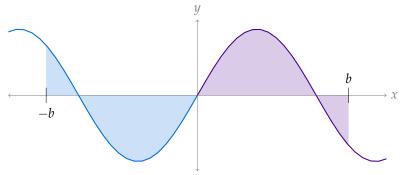

## INTEGRALS OF EVEN FUNCTIONS

Suppose f(x) is even. Then

$$\int_{-h}^{b} f(x) \, \mathrm{d}x =$$

## INTEGRALS OF ODD FUNCTIONS

Suppose f(x) is odd. Then

$$\int_{-h}^{b} f(x) \, \mathrm{d}x =$$

## Theorem 1.2.12 (Even and Odd)

Let a > 0.

(a) If f(x) is an even function, then

$$\int_{-a}^{a} f(x) \, \mathrm{d}x = 2 \int_{0}^{a} f(x) \, \mathrm{d}x$$

(b) If f(x) is an odd function, then

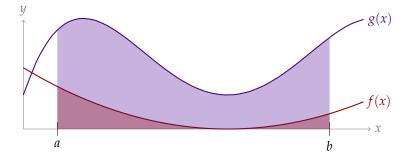

$$\int_{-a}^{a} f(x) \, \mathrm{d}x = 0$$

## Integral Inequality

Let  $a \le b$  be real numbers and let the functions f(x) and g(x) be integrable on the interval  $a \le x \le b$ .

If  $f(x) \le g(x)$  for all  $a \le x \le b$ , then

$$\int_{a}^{b} f(x) \, \mathrm{d}x \le \int_{a}^{b} g(x) \, \mathrm{d}x$$

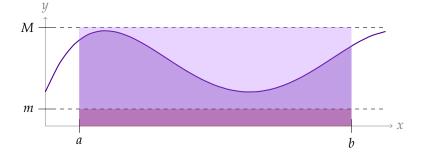

## **Integral Inequality**

Let  $a \le b$  and  $m \le M$  be real numbers and let the function f(x) be integrable on the interval  $a \le x \le b$ .

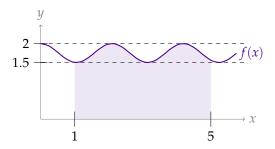

If  $m \le f(x) \le M$  for all  $a \le x \le b$ , then

$$m(b-a) \le \int_a^b f(x) dx \le M(b-a)$$

#### Find a lower bound c and an upper bound d such that

$$c \le \int_1^5 f(x) \, \mathrm{d}x \le d$$

## Find a lower bound c and an upper bound d such that $d - c \le 3$ and

$$c \le \int_0^6 f(x) \, \mathrm{d}x \le d$$

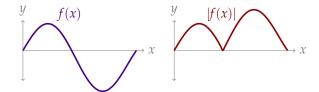

$$2$$

$$1.5$$

$$5 \quad 6 \quad f(x) \quad 8$$

## ABSOLUTE VALUES

$$f(x) \le |f(x)|$$
 for any  $f(x)$   
 $-f(x) \le |f(x)|$  for any  $f(x)$ 

$$\left| \int_{a}^{b} f(x) dx \right| \leq \int_{a}^{b} |f(x)| dx$$

because  $\left| \int_a^b f(x) \, dx \right|$  is either  $\int_a^b f(x) \, dx$  or  $-\int_a^b f(x) \, dx$ .
