SEQUENCES AND SERIES

A **sequence** is a list of numbers

A **series** is the sum of such a list.

SERIES PHILOSOPHY

What does it really mean to add up infinitely many things?

$$1 - 1 + 1 - 1 + 1 - 1 + 1 - 1 + 1 - 1 + 1 - 1 + 1 - 1 + \cdots$$

The diagram illustrates the partial sums of the series $1 - 1 + 1 - 1 + \dots$. It shows the sequence of terms and the partial sums below them. The terms are $1, -1, 1, -1, 1, -1, 1, -1, 1, -1, 1, -1, 1, -1, \dots$. The partial sums are $1, 0, 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, \dots$. The partial sums are represented by the number '1' below the terms. The first '1' is connected to the first term '1' by a vertical purple arrow. The second '1' is connected to the first two terms '1' and '-1' by two blue arrows. The third '1' is connected to the first three terms '1', '-1', and '1' by three purple arrows. The fourth '1' is connected to the first four terms '1', '-1', '1', and '-1' by four blue arrows. The fifth '1' is connected to the first five terms '1', '-1', '1', '-1', and '1' by five purple arrows. This pattern continues, showing that the partial sums are always 1 or 0, and the series does not converge to a single value.

Definition

The N^{th} partial sum of the series $\sum_{n=1}^{\infty} a_n$ is the sum of its first N terms

$$S_N = \sum_{n=1}^N a_n.$$

The partial sums form a sequence $\{S_N\}_{N=1}^{\infty}$. If this sequence of partial sums converges $S_N \rightarrow S$ as $N \rightarrow \infty$ then we say that the series $\sum_{n=1}^{\infty} a_n$ converges to S and we write

$$\sum_{n=1}^{\infty} a_n = S$$

If the sequence of partial sums diverges, we say that the series diverges.

Geometric Series

Let a and r be two fixed real numbers with $a \neq 0$. The series

$$a + ar + ar^2 + ar^3 + \dots$$

is called the **geometric series** with first term a and ratio r .

We call r the *ratio* because it is the quotient of consecutive terms:

$$\frac{ar^{n+1}}{ar^n} = r$$

Let a and r be two fixed real numbers with $a \neq 0$. The series

$$a + ar + ar^2 + ar^3 + \dots$$

is called the **geometric series** with first term a and ratio r .

We call r the *ratio* because it is the quotient of consecutive terms:

$$\frac{ar^{n+1}}{ar^n} = r$$

Another useful way of identifying geometric series is to determine whether all pairs of consecutive terms have the same ratio.

- ▶ Geometric: $1 + \frac{1}{5} + \frac{1}{5^2} + \frac{1}{5^3} + \frac{1}{5^4} + \dots$
- ▶ Geometric: $\sum_{n=0}^{\infty} \frac{1}{2^n}$
- ▶ Not geometric: $1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \frac{1}{6} + \dots$

Consider the partial sum S_N of a geometric series:

$$S_N = a + ar + ar^2 + ar^3 + \cdots + ar^N$$

Consider the partial sum S_N of a geometric series:

$$S_N = a + ar + ar^2 + ar^3 + \cdots + ar^N$$
$$rS_N =$$

Consider the partial sum S_N of a geometric series:

$$\begin{aligned} S_N &= a + ar + ar^2 + ar^3 + \cdots + ar^N \\ rS_N &= \quad ar + ar^2 + ar^3 + \cdots + ar^N + ar^{N+1} \end{aligned}$$

Consider the partial sum S_N of a geometric series:

$$S_N = a + ar + ar^2 + ar^3 + \cdots + ar^N$$

$$rS_N = ar + ar^2 + ar^3 + \cdots + ar^N + ar^{N+1}$$

$$rS_N - S_N =$$

Consider the partial sum S_N of a geometric series:

$$S_N = a + ar + ar^2 + ar^3 + \cdots + ar^N$$

$$rS_N = ar + ar^2 + ar^3 + \cdots + ar^N + ar^{N+1}$$

$$rS_N - S_N = -a + ar^{N+1}$$

Consider the partial sum S_N of a geometric series:

$$S_N = a + ar + ar^2 + ar^3 + \cdots + ar^N$$

$$rS_N = ar + ar^2 + ar^3 + \cdots + ar^N + ar^{N+1}$$

$$rS_N - S_N = -a + ar^{N+1}$$

$$S_N(r - 1) = ar^{N+1} - a$$

If $r \neq 1$, then

$$S_N = \frac{ar^{N+1} - a}{r - 1} = a \frac{r^{N+1} - 1}{r - 1}$$

GEOMETRIC SERIES

New bitcoins are produced when a particular type of computational problem is solved. Every time 210,000 solutions are found, the number of bitcoins each solution can produce is cut in half.

- ▶ Each of the first 210,000 solutions can produce 50 bitcoins.
- ▶ Each of the next 210,000 solutions can produce $\frac{50}{2}$ bitcoins.
- ▶ Each of the next 210,000 solutions can produce $\frac{50}{2^2}$ bitcoins.
- ▶ Each of the next 210,000 solutions can produce $\frac{50}{2^3}$ bitcoins.

Assume that this continues forever, and that bitcoins are infinitely divisible.¹ How many bitcoins can possibly be produced?

¹Actually the smallest allowed division of a bitcoin is 10^{-8} .
